1.2 Concept

The prescribed substance is usually medication. However, medical aids and bandages can also be prescribed

and supplied via the pharmacy. Food and blood products do not strictly belong in the medication category, but can be prescribed and supplied by a pharmacy as well.

A type of medication can be indicated with a **single code**. That code can be chosen from several possible coding systems (concretely: GPK, PRK, HPK or article numbers). Correct use of these codes in the software systems will sufficiently record the composition of the product used, making a complete product specification unnecessary.

In addition to a primary code, **alternative codes** from other coding systems can also be entered (so that the GPK can be sent along in the event that the patient was registered based on PRK, for example).

Entering multiple ingredients will enable you to display a compound product. If one of the composite parts is liquid, the dosage will be given in milliliters; otherwise it will be given in 'units'.

In that case, the **composition of the medication** can be specified implicitly (with the use of a medication code) or explicitly, for example by listing the (active) ingredient(s) of the medication.

Magistral prescriptions can be entered as well. This can be done by means of the option listed above to enter coded ingredients and/or by entering the composition and preparation method as free text. This is a partial information model

1.4 Purpose

The purpose of Product is to unambiguously describe the medication to be used.

1.7 Information Model

«rootconcept»	PharmaceuticalProduct
Definitie	Root concept of the PharmaceuticalProduct partial information model. This root concept contains all data elements of the PharmaceuticalProduct partial information model.

Opties	

«data»	MedicationCode
Definitie	<p>Coding medication in the Netherlands is done on the basis of the G standard (issued by Z index), which is filled under the direction of KNMP. The coded medication can be expressed as:</p> <ul style="list-style-type: none"> • Global Trade Item Number (GTIN) • Z index number (ZI number) • Trade product code (HPK) • Prescription code (PRK) • Generic product code (GPK) • Anatomic Therapeutic Classification code (ATC) <p>The GTIN enables identification of the product including its origin with a</p>

	<p>barcode.</p> <p>The ZI number represents the trade product and the package size.</p> <p>The HPK is the code for the trade product (with the brand name) as used per dose/per time the medication is taken (1 pill, 1 puff, 1ml).</p> <p>The PRK contains als GPK information supplemented with information needed to prescribe the right product. This level is intended to facilitate generic prescription of drugs.</p> <p>The GPK defines the pharmaceutical characteristics of a product: ingredients, strengths, units, pharmaceutical form and route of administration.</p> <p>The Substance Name Code (SNK) is the (active) compound.</p> <p>Further information about the G Standaard levels see https://www.z-index.nl.</p> <p>So-called 90.000.000 numbers are used in local IT systems. These numbers shall not be used for external communication. In this case only the description (not the code) may be included. This is in accordance with national agreements (Nictiz Standard).</p>

«data»	PharmaceuticalForm
Definitie	The pharmaceutical form indicates the form of the medication. Examples include: tablet, suppository, infusion liquid, ointment. If the product has a GPK code in the G standard, the form will be known in the G standard. For products without a code (free text, preparation by the pharmacy), the means of administration can be entered.
