## 1.2 Concept

Tobacco is a product that comes from the leaves of the tobacco plant, which is smoked as a drug. Smokable forms of tobacco include rolling tobacco, cigarettes, cigars and pipe tobacco. This building block describes the information asked of the patient about their use of tobacco.

## 1.3 Mindmap

## 1.4 Purpose

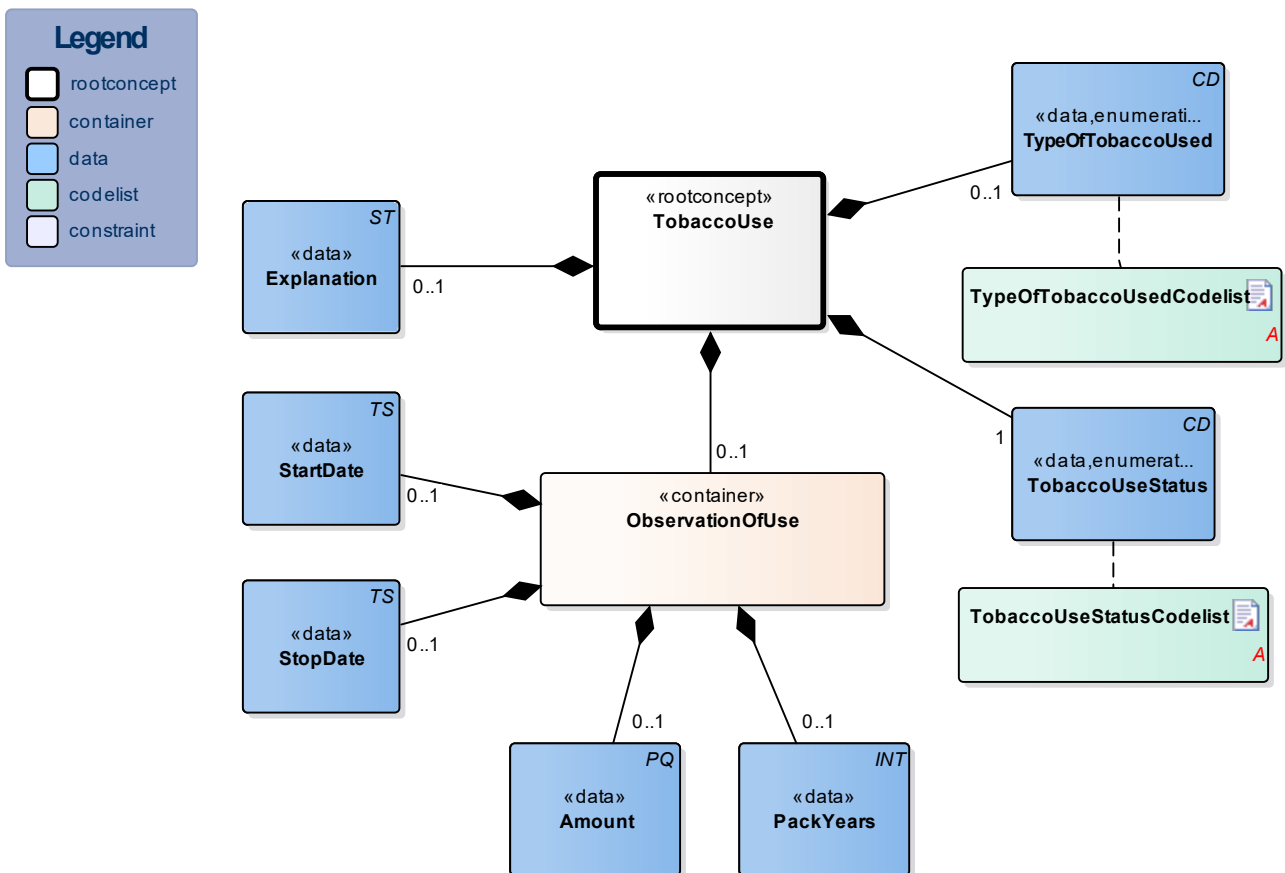

During the social anamnesis, the patient is frequently asked about their use of tobacco or exposure to tobacco smoke at home or elsewhere. Information on tobacco use can be important for treatment and diagnostics.

## 1.5 Patient Population

## 1.6 Evidence Base

Exposure to tobacco is an important risk factor for things like neoplasms, degenerative diseases and vascular incidents. During the anamnesis, the patient is often asked about their current smoking pattern and number of pack years. The number of pack years is the unit that describes the total exposure to tobacco smoke, which is the number of smoked packs of cigarettes per day (one pack = 20 cigarettes) times the number of years of smoking. A different formula is often used for rolling tobacco and pipes, with one of the parameters being the number of grams per week.

«data»	PackYears
Definitie	The unit indicating the smoker's total exposure to tobacco smoke. For cigarettes, this is calculated using the number of smoked packs of cigarettes per day (one pack = 20 cigarettes) times the number of years of smoking. For other forms of tobacco, this is usually converted to an equivalent cigarette consumption. Often, only the number of pack years is estimated.
