### 1.2 Concept

Malnutrition is a nutritional condition in which the patient has an imbalance of energy, protein and other nutrients leading to measurable negative effects on the body's composition and functioning. This is largely caused by a clinically relevant reduction in muscle mass.

Ill and vulnerable elderly people are particularly prone to malnutrition.

Aids in determining (the risk of) malnutrition are validated screening tools such as the MUST and SNAQ questionnaire.

### 1.3 Mindmap

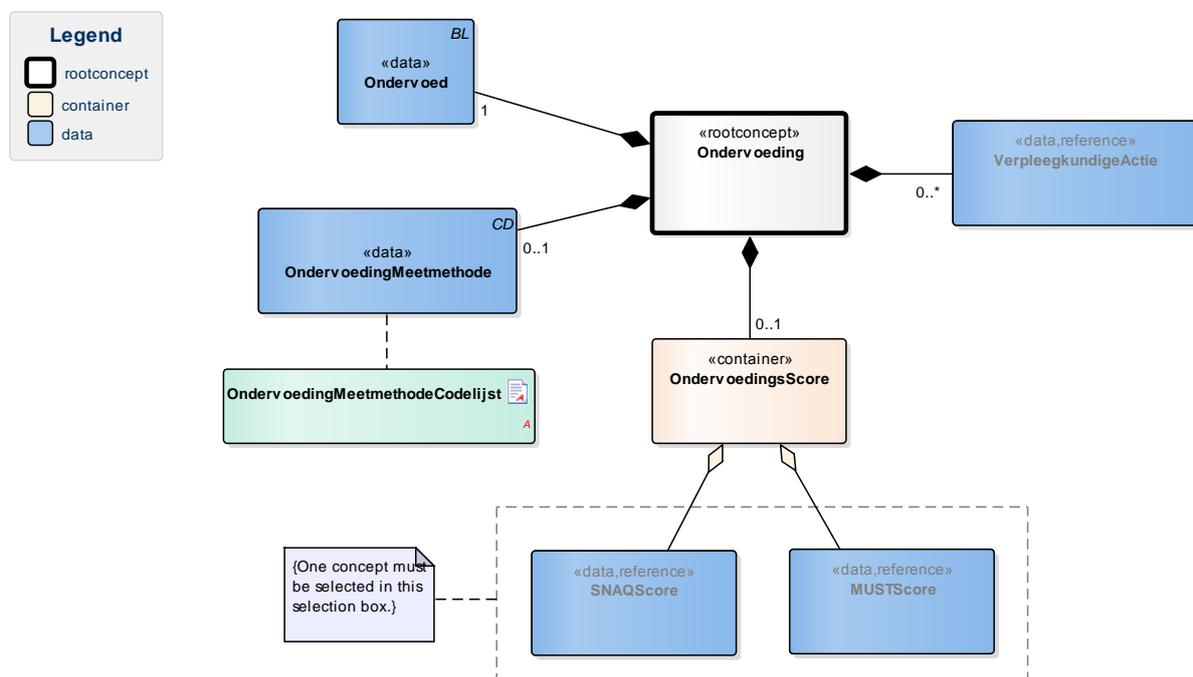

## 1.4 Purpose

Malnutrition can lead to a significantly slower recovery, complications in the event of illness and operations and above all, higher mortality. Insight into the extent of (or risk of) malnutrition can help prevent malnutrition or prevent the nutritional condition from getting worse.

## 1.5 Patient Population

## 1.6 Evidence Base

## 1.7 Information Model

«rootconcept»	Ondervoeding	
<b>Definitie</b>	Root concept of the Malnutrition information model. This root concept contains all data elements of the Malnutrition information model.
