## 1.1 Revision History

Publicatieversie 1.0 (04-09-2017)

## 1.2 Concept

The FLACC (Faces, Legs, Activity, Cry and Consolability) is a pain assessment tool, that is used to assess pain in children aged 0-7 years old by observing their behaviour.

The FLACC has five subscales that need to be addressed. The final score indicates whether the observed child suffers pain and 'how much'. The score is often combined with a NRS-score that is completed by the nurses on basis of clinical experience.

## 1.3 Mindmap

## 1.4 Purpose

A pain assessment instrument is a tool in determining the intensity of pain and can be useful in order to determine the effectiveness of pain treatment interventions (pharmacological or non-pharmacological). For young children, it is nevertheless difficult to differentiate between pain or distress/anxiety. This difference is relevant in determining the treatment. The score on a pain assessment instrument remains a snapshot in time.

## 1.5 Patient Population

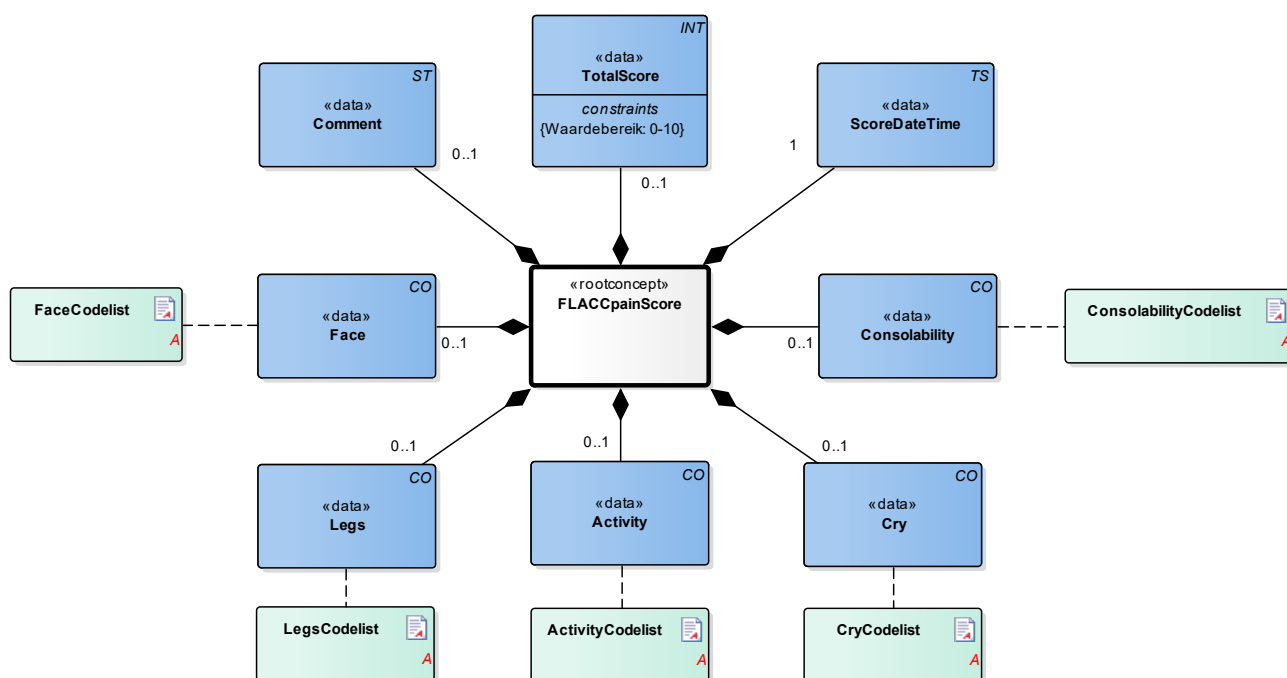

The FLACC assessment score used to assess pain in children between the ages of 0 and 7 years

## 1.6 Evidence Base

For assessing the degree of pain in children with difficulty expressing themselves a number of pain observation instruments exist:

- CPB
- Comfort Behaviour Scale/ Comfortneo Scale
- FLACC
